

Question 50: (translated from French)

After verification, here are a few clarifications as a follow-up to Question #46: the involved RCM has, for the municipality concerned by our project, the centroids for the units of assessment in digital form but does not have the boundaries of these units of assessment. The centroids are in a specific form and are included within the boundaries of the corresponding unit of assessment. They contain descriptive and identifying information on each unit of assessment involved. Given that the cadastral reform has still not been conducted at our site, that the information requested in section 3.2.2 “boundary of the unit of assessment” (HQ_unite_eval) in digital form does not exist, and that creating assessment units boundaries in digital form is a sizeable task, would it be possible to use the lot units boundary in digital form or simply not provide the requested layer of information?

Answer 50:

The RCMs or municipalities are required by regulation (c. F-2.1, r.13.4) to have the units of assessment boundaries, either in graphical form on paper or in a digital graphic register (i.e. georeferenced). If the units of assessment boundaries are only available on paper from the local authorities, the bidder is responsible for georeferencing the data in order to produce the digital map required under section 3.2.2 of the Bid Form.

Hydro-Québec Distribution is not prepared to modify this requirement.
