Evaluation of the Potential Carcinogenicity of 60-Hz Linear, Sinusoidal, Continuous-Wave Magnetic Fields in Fischer F344 Rats: Final Report. Prepared by Institut Armand-Frappier for Hydro-Québec, Ontario Hydro and Health Canada.
Laval (Qc), Institut Armand-Frappier. Report and 4 appendices.

Abstract: This two-year experimental study was conducted at the Institut Armand Frappier. It was the first study to analyze the carcinogenic potential of magnetic fields on chronically exposed rats according to the test protocol of the National Toxicology Program, which was introduced by the U.S. National Institute of Environmental Health Sciences to ensure objective assessment of the carcinogenicity of chemicals.
