

Decommissioning of the Gentilly-2 facilities

Gentilly-2 at a glance

Commissioned in 1983, Gentilly-2 nuclear power plant ceased operations on December 28, 2012, after 29 years of safe operation. It had an installed capacity of 675 MW and was equipped with a CANDU (CANada Deuterium Uranium) reactor.

What is decommissioning?

Decommissioning is the process that leads to the final shutdown of a nuclear facility and restoration of the site to a predetermined final condition. The process includes putting the reactor in a guaranteed shutdown state, and decontaminating and dismantling the facility.

Demolition of two buildings

By 2025, the water treatment plant and the periodic inspection building will be demolished. These buildings are no longer needed under the decommissioning plan.
